
Use of Calcium Borogluconate and Electrolyte Solutions Containing Calcium

NZFSA have confirmed on 8th September, 2010 that USDA has reviewed the use of Calcium borogluconate, and electrolyte solutions containing calcium. As a result, New Zealand is able to use these products as electrolytes under the NOP regulations. Please note: USDA have reiterated that antibiotics are not allowed in the mixture. Records will need to be kept to record where animals have been treated with electrolytes - as is normal practise.
